

Week 9 Group Reflection

Customer Value and Scope

This week we reprioritized with the stakeholder and put more focus towards polishing and fixing bugs, while implementing some small new features. This is to make sure that the application is actually usable for the stakeholder once the project is finished. We have thought about continuing the work on the application during the summer since we believe we can reach a point where we and the stakeholder not only can use the application but find it better than the alternative solutions. We will discuss this with the stakeholder our next meeting, to see if he is willing to continue the work with us. This week was harder to estimate time for since much of the work was debugging and refining already existing features, but we gave it a shot to get a common estimation to see approximately how much time we each needed to put in. We check our completed user stories with the stakeholder to make sure they are what he envisioned, this lets the stakeholder have the final work on how the product will work since nothing will be finished without his approval.

Design decisions and product structure

We try to update the java documentation continuously after every update or change in the code. Code quality is ensured by discussing within the group. We've done a lot of manual testing and spent many hours on bug fixing in order to raise the code quality.

Application of Scrum

We spoke with our PO about the current situation with the project, how the current sprint was going and if he considered our user stories to be viable. Also, he helped us re-prioritize our user stories.
